U.S. Citizen

EDUCATION

Salem State University (SSU)

Salem, MA

Bachelor of Science in Computer Science, Concentrations in Software Engineering

SKILLS

Languages: Python, Java, JavaScript, TypeScript, C, C++, CSS, HTML

Technologies & Frameworks: React, Node.js, Express, REST APIs, Tailwind CSS

Cloud & Infrastructure: AWS (Lambda, API Gateway, CDK), Azure, GitHub Actions, Render, Vercel

Databases: MongoDB, MySQL, Amazon DynamoDB, Amazon Aurora, Snowflake, Amazon Neptune

Tools: GitHub, Datadog, Splunk, Jira

Machine Learning: Neural networks, classification & regression models

Development Practices: Agile (Scrum, sprints, PI planning), Waterfall

EXPERIENCE

Liberty Mutual Insurance

GRS – TechMod – Technology Associate

January 2026 – Present

- Built and iterated on a dynamic dashboard featuring configurable columns, filtering, and data export, incorporating stakeholder feedback from design reviews to shape the product direction
- Implemented OIDC authentication, integrated the FLUID design system into the React frontend, and built Excel ingestion API routes enabling structured data upload into Neptune
- Owned frontend development from initial mockups and design reviews through implementation, bug resolution, and iterative stakeholder feedback
- Implemented an AWS Lambda-based Neptune DB curfew to automatically shut down the database on a schedule, reducing cloud spend by roughly ~67%

GDS – DPM & VMP – Infrastructure Engineering Intern

June 2025 – January 2026

- Developed and maintained an internal storage reporting application and its LLM-powered assistant, enabling natural language queries over live infrastructure data; extended the system with an MCP server, reducing AI context size by 99% (45MB → ~5KB) and improving response accuracy from ~65% to 95%+, and reducing token usage
- Built an internal DNS lookup tool against Liberty Mutual's DNS API to batch-query ~1,500 NAS volumes, identifying active vs. unreachable servers to surface orphaned infrastructure and flag cost avoidance opportunities
- Conducted a comprehensive ICOS audit across 45 vaults and 5 application categories, identifying ~\$354K in potential cost avoidance; delivered stakeholder reporting to support decommissioning decisions with leadership
- Led VM decommissioning initiative spanning 762 orphaned virtual machines, driving 94% tech debt reduction (715 VMs deleted) through owner identification, cross-team outreach, and coordination across 6+ engineering teams
- Designed an Azure backup monitoring POC using Recovery Services Vaults, Log Analytics Workspaces, KQL Alert Rules, and Logic Apps — establishing automated detection and alerting for failed backup jobs where no prior visibility existed

PROJECTS

Car-vs-Car | Full-Stack Web Application (Solo Project)

- Built and deployed a full-stack car comparison platform using the MERN stack, enabling users to evaluate and compare vehicles through visualized performance metrics
- Integrated OpenAI APIs to deliver AI-powered vehicle recommendations based on user preferences

SSU Social | Full-Stack Web Application (Team Project)

- Drove technical direction through presentations and code delivery, managing cloud infrastructure with Amazon S3 and deploying via Render
